

ABSTRACT

A high temperature aqueous based zirconium (IV) crosslinked guar fracturing fluid having a pH from about 9 to about 12 includes a polymer solution and a zirconium (IV) crosslinking. The polymer solution includes an aqueous fluid, natural guar, a, a pH, and a delaying agent., where those agents are combined to produce a fracturing fluid suitable to the purposes of hydraulically fracturing subterranean formations with static bottom-hole temperatures greater than about 250°F
